**Working with files** AutoCAD can open, create, and edit multiple files simultaneously. You can edit the same part of one drawing file while keeping another file open and editing a different part of it. Using multiple files makes it possible to work on different parts of a single project. You can also work on different parts of a single drawing file. When opening a file, you can specify the name of the file on the command line or on the File Open dialog box. To create a new file, choose File | New | Document or open the File | New menu. You can also choose File | Open | Other | Open CAD Doc. Note that you can also add, name, and save files to your hard disk on the fly. To do this, choose File | Open | Other | Add. You can add a new document, Excel spreadsheet, or presentation slide to your hard disk without first saving it to your hard disk. You can also open, close, and edit files with one click, using File | Open | New. To save a file, choose File | Save. You can also save a file to a network or Internet server. Note that most drawing files contain references to other drawing files and other drawing data. For instance, a project consists of multiple files. A drawing file contains references to other drawing files, including other drawing files that make up the project. You can add and edit drawing data in drawing files without changing the drawing data in other drawing files.

**Viewing Drawing Data** You can view drawing data in a drawing file by using various options on the View menu. Each option is explained in the sections that follow.

**Tools** The most commonly used drawing tools in AutoCAD are the Shape Builder tool and 3D modeling tools. You can use them to add shapes to a drawing file. To add a new shape to a drawing, select the Shape Builder tool on the toolbar. To select it, choose View | Shapes. The Shape Builder tool has three modes: Shape, Edge, and Surface.
